## $\overline{\mathbf{VIM}}$

#### Global

:help keyword  $\rightarrow$  open help for keyword :o file  $\rightarrow$  open file :saveas file  $\rightarrow$  save file as :close  $\rightarrow$  close current pane

#### **Cursor Movement**

 $h \to \text{move cursor left}$ 

 $j \rightarrow \text{move cursor right}$ 

 $k \to \text{move cursor up}$ 

 $1 \rightarrow$  move cursor down

 $H \rightarrow$  move to top of screen

 $M \rightarrow$  move to middle of screen

 $L \rightarrow$  move to bottom of screen

 $\mathbf{w} \to \text{jump}$  forward to the start of a word

 $W \rightarrow \text{jump forward to the start of a word (words can contain punctuation)}$ 

 $e \rightarrow jump$  forward to the end of a word

 $E \rightarrow \text{jum forward to the end of the word (words can contain punctuation)}$ 

 $b \rightarrow jump$  backward to the start of a word

 $B \rightarrow \text{jump backward to the start of a word (words can contain punctuation)}$ 

 $0 \rightarrow \text{jump to the start of a line}$ 

 $\wedge \rightarrow$  jump to first non-blank character of the line

 $\$ \rightarrow \text{jump to the end of the line}$ 

 ${\bf g} \to {\rm jump}$  to the last non-blank character of the line

 $gg \rightarrow go$  to the first line of the document

 $G \to go$  to the last line of the document

 $5G \rightarrow go to line 5$ 

 $:\!\!\mathbf{x} \rightarrow \mathrm{go}$  to line number  $\mathbf{x}$ 

 $fx \rightarrow jump$  to the next occurance of charater x

 $tx \rightarrow jump$  to before next occurance of character x

 $\rightarrow$  jump to next paragraph (or function block, when editing code)

-  $\rightarrow$  jump to previous paragraph (or function block when editing code)

 $zz \rightarrow$  center cursor on screen

 $Ctrl+b \rightarrow move back one full screen$ 

 $Ctrl+f \rightarrow move forward one full screen$ 

 $Ctrl+d \rightarrow move down half screen$ 

 $Ctrl+u \rightarrow move up half screen$ 

Tip: Prefix a cursor movement command with a number to repeat it. For example, 4j moves down 4 lines

#### Insert Mode

 $i \rightarrow insert$  before the cursor

 $I \rightarrow insert$  at the beginning of the line

 $a \rightarrow insert$  (append) after the cursor

 $A \rightarrow \text{insert (append)}$  at the end of the line

 ${\color{blue} \mathbf{o}} \rightarrow \mathrm{append}$  (open) a new line below the current line

 ${\color{red}\mathrm{O}} \to \mathrm{append}$  (open) a new line above the current line

 $\mathbf{ea} \to \mathrm{insert}$  (append) at the end of the word

 $Esc \rightarrow exit insert mode$ 

## **Editing**

 $r \rightarrow$  replace a single character

 $R \rightarrow$  replace multiple character

 $J \rightarrow join line below to the current line$ 

 $\mathbf{cc} \to \mathrm{change}$  (replace) entire line (enters the insert mode)

 $cw \rightarrow change$  (replace) to the end of the word

 $c\$ \rightarrow \text{change (replace)}$  to the end of the line

 $s \rightarrow$  delete character and substitute text

 $S \rightarrow$  delete line and substitute text (same as cc)

 $xp \rightarrow transpose two letters (delete and paste)$ 

 $\mathbf{u} \to \mathrm{undo}$ 

 $Ctrl+r \rightarrow redo$ 

 $. \rightarrow$  repeat last command

#### Visual Mode

 $v \rightarrow start$  visual mode, mark line, then do a command (like y-yank)

 $V \rightarrow \text{start linewise visual mode}$ 

 $Ctrl+v \rightarrow Start$  blockwise visual mode

 $o \rightarrow$  move to the end of marked area

 $0 \rightarrow$  move to the oher corner of block

 $\mathbf{xaw} \to \mathrm{mark} \ \mathbf{x} \ \mathrm{words}$ 

 $ab \rightarrow a block with ()$ 

 $aB \rightarrow a$  block with  $\{\}$ 

 $ib \rightarrow inner block with ()$ 

 $iB \rightarrow inner block with \{\}$ 

 $Esc \rightarrow exit visual mode$ 

 $\rightarrow$  shift text right

 $\leq$   $\rightarrow$  shift text left

 $y \rightarrow yank (copy) marked text$ 

 $\frac{d}{d} \rightarrow \text{delete marked text}$ 

 $\sim \rightarrow$  switch case

## Cut and Paste

 $yy \rightarrow yank (copy) a line$ 

 $2yy \rightarrow yank (copy) 2 lines$ 

 $yw \rightarrow yank$  (copy) the characters of the word from the cursor position to the start of the next word

 $y\$ \rightarrow yank (copy)$  to end of line

 $p \rightarrow put$  (paste) the clipboard after cursor

 $P \rightarrow put (paste) before cursor$ 

 $dd \rightarrow delete (cut) a line$ 

 $xdd \rightarrow delete (cut) x lines$ 

 $xdw \rightarrow delete$  (cut) x words from the cursor posi-

tion to the start of the next word

 $D \rightarrow delete$  (cut) to the end of the line

 $d\$ \rightarrow delete$  (cut) to the end of the line

 $d \wedge \rightarrow$  delete (cut) to the first non-blank character of the line

 $d0 \rightarrow delete$  (cut) to the begining of the line  $x \rightarrow delete$  (cut) character

## **Exiting**

:w  $\rightarrow$  write (save) the file, but don't exit :w !sudo tee %  $\rightarrow$  write out the current file using sudo

:wq or :x or ZZ  $\rightarrow$  write (save) and quit :q  $\rightarrow$  quit (fails if there are unsaved changes) :q! or ZQ  $\rightarrow$  quit and throw away unsaved changes

## Search and Replace

#### Search

 $/pattern \rightarrow search for pattern$ 

?pattern → search backward for pattern

 ${
m vpattern} 
ightarrow {
m 'very ~ magic' ~ pattern: ~ non-} \ {
m alphanumeric ~ characters ~ are interpreted ~ as ~ special regex symbols (no escaping needed)}$ 

:%s/pattern//gn  $\rightarrow$  count the number of matches of a **pattern** in the current buffer

:%s/pattern//n  $\rightarrow$  count the number of matches of a pattern

:a,bs/pattern//gn  $\rightarrow$  count the number of matches of a pattern from line **a** to **b** 

:'<,'>s/pattern//gn  $\rightarrow$  count the number of matches of a **pattern** in the lines in the most recent visual selection

:%s///gn  $\rightarrow$  count the number of occurrences of the last used search pattern

 $n \to {
m repeat}$  search in same direction

 $N \rightarrow$  repeat search in opposite direction

:noh  $\rightarrow$  remove highlighting of search matches

### Replace

:%s/old/new/g  $\rightarrow$  replace all old with new throughout file

:% $s/old/new/gc \rightarrow replace$  all **old** with **new** throughout file with confirmations

:%s/old/new/gci  $\rightarrow$  replace all old (case sensitive because of flag i) with new throughout file with confirmations (%s/old\c/new/gci does the same thing)

:%s/\ $\langle old \rangle$  /new/gc  $\rightarrow$  replace all old (exact pattern) with new throughout file with confirmations :.,+as/foo/bar/g  $\rightarrow$  replace all old with new for the current line (.) and the a lines.

 $:g/\wedge word/s/old/new/g \rightarrow replace$  all **old** with **new** for each line that starts with **word** 

:s/foo/bar/g  $\rightarrow$  replace all **old** with **new** in the current line.

 $:A,Bs/foo/bar/g \rightarrow \text{replace all old with new from line } A \text{ to } B.$ 

Notes:  $/ \t$  is tab,  $/ \t$  is white space,  $/ \t$  is new line,

After an opening [, everything until the next closing ] specifies a collection.

## Sessions

:mksession  $\sim/x.vim \rightarrow$  create a session named **x.vim** and save it

:source  $\sim/x.vim \rightarrow$  restore session named x.vim, while in vi

 $vim - S \sim /x.vim \rightarrow restore a session named x.vim (in command line)$ 

#### Miscellaneous

:ab word1 word2  $\rightarrow$  change word1 to word 2 (helps to store abbreviations or avoid common typos) :una word  $\rightarrow$  remove word from the list of abbreviations

 $ab \rightarrow b$  lists all the abbreviations being used

Tip: The abbreviations work at local level, and once the session gets over those are lost. In order to make it universal, go to '.vimrc' and add the command :iabbrev w1 w2

## Marks

 $\begin{array}{l} : marks \rightarrow list \ of \ marks \\ ma \rightarrow set \ current \ position \ for \ mark \ A \\ \hbox{`a} \rightarrow jump \ to \ position \ of \ mark \ A \\ \hbox{y'a} \rightarrow yank \ text \ to \ position \ of \ mark \ A \end{array}$ 

## Multiple Tabs and windows

```
vi - p \times y \times z \rightarrow open files x, y and z
:tabnew x \to \text{open file } x \text{ in a new tab}
:tabc \rightarrow close the tab
:tabn \rightarrow switch to next tab
:tabp \rightarrow switch to previous tab
:tabn \mathbf{x} \to \text{move to } \mathbf{x}^{th} tab
gt or :tabnext or :tabn \rightarrow move to the next tab
gT or :tabprev or :tabp \rightarrow move to the previous
xgt \rightarrow go to x^{th} tab
:tabr \rightarrow move to first tab
:tabl \rightarrow move to last tab
:tabs \rightarrow list all open tabs
:tabmove \mathbf{x} \to \text{move current tab to the } \mathbf{x}^{th} position
(indexed from 0)
:tabclose or :tabc \rightarrow close the current tab and all
its windows
:tabonly or :tabo \rightarrow close all tabs except for the
current one
:tabdo command \rightarrow run the command on all tabs
(e.g. :tabdo q - closes all opened tabs)
:qa \rightarrow close all open tabs
:wa \rightarrow save all the open tabs
:qwa or :xa \rightarrow save and exit all open tabs
\mathbf{x} \rightarrow \mathbf{x} open file \mathbf{x} in this window (closes the previ-
ous file)
:ls \rightarrow show the list of currently open buffers (win-
dows)
:b \mathbf{x} \to \text{go to buffer (window) } \mathbf{x}
\operatorname{split} \mathbf{x} \to \operatorname{split} window horizontally and load file \mathbf{x}
:vs x \rightarrow split window vertically and open file x
(readmode only)
:vsplit x \to \text{split} window vertically and open file x
:hide \rightarrow close the current window
: only \to keep only the current window open
Ctrl + ww \rightarrow switch windows
Ctrl + wq \rightarrow quit a window
Ctrl + wv \rightarrow split window vertically
Ctrl + wh/wl \rightarrow move cursor to the left/right win-
dow (vertical split)
Ctrl + wj/wk \rightarrow move cursor to the window be-
low/above (horizontal split)
Ctrl + wT \rightarrow move the current split window into
its own tab
:e file \rightarrow edit a file in a new buffer
:bnext or :bn \rightarrow go to the next buffer
:bprev or :bp \rightarrow go to the previous buffer
:bd \rightarrow delete a buffer ( close a file)
:ls \rightarrow list all open buffers
sp file \rightarrow open a file in a new buffer and split win-
:vsp file \rightarrow open a file in a new buffer and vertically
split window
```

## Search in Multiple Files

:vimgrep /pattern/ file  $\rightarrow$  search for pattern in multiple files :cn  $\rightarrow$  jump to the next match :cp  $\rightarrow$  jump to the previous match :copen  $\rightarrow$  open a window containing the list of matches

## Registers

```
\begin{tabular}{ll} :reg $\rightarrow$ show registers content \\ "xy $\rightarrow$ yank into register $x$ \\ "xp $\rightarrow$ paste into register $x$ \\ \end{tabular}
```

Tip: Registers are stored in /.viminfo, and will be loaded again on next restart of vim. Tip: Register 0 always contains the value of the last yank

#### Macros

 $\mathbf{qa} \to \operatorname{record\ macro\ } \mathbf{a}$   $\mathbf{q} \to \operatorname{stop\ recording\ macro\ } \mathbf{a}$   $\mathbf{a} \to \operatorname{run\ macro\ } \mathbf{a}$   $\mathbf{a} \to \operatorname{run\ macro\ } \mathbf{a}$   $\mathbf{a} \to \operatorname{run\ macro\ } \mathbf{a}$ 

## Opening a file from another folder while being inside VIM

:Ex  $\rightarrow$  Opens the pwd. Can navigate through the folders by moving up and down to the name of the folder and pressing Enter.

:Ex  $\langle directory \rangle \rightarrow$  Takes you to the directory. Once inside the directory, navigate to the file you want to open and press enter.

## **Terminal**

source .bashrc  $\rightarrow$  Updates terminal with the updated .bashrc file

history  $\mathbf{x} \to \text{Displays last } \mathbf{x}$  used commands history | grep str  $\to \text{Displays}$  all commands which started with str (You have aliased this command to ch (in .bashrc), so can just use ch str instead of history | grep str ).

 $ctrl+u \rightarrow Deletes$  everything before cursor  $ctrl+k \rightarrow Deletes$  everything after cursor  $ctrl+l \rightarrow Clear$  the screen nautilus /path/folder  $\rightarrow Open$  the folder  $!\# \rightarrow run$  command number # !str  $\rightarrow$  execute last command that began with str

!?str?  $\rightarrow$  execute last command that contains str (and not necessarily starts with)

cat or less  $\sim$  /.bash\_history  $\rightarrow$  print out the history file

ls -1 | wc -l  $\rightarrow$  counts the number of files in the present directoy

 $\frac{du}{du}$  -command file/folder  $\rightarrow$  has several uses based on the command given. Following are few examples:

- ullet  $\to$  Without any additional command, gives the size of each folder and sub-folders.
- $-a \rightarrow$  Gives the size of every folder and file
- $-h \rightarrow \text{Outputs size in human readable format.}$
- -s  $\rightarrow$  Gives the summary of sizes.
- $-k/m \rightarrow$  Gives size in kilobyte/ megabytes.
- $-c \rightarrow$  Gives total disk space in the last line.
- -exclude= '\*.fmt'  $\rightarrow$  Excludes displaying results of file with format fmt .
- -time → Shows disk usage based on last modification time and displays time of modification as well.

man command  $\rightarrow$  Shows the manual for command find command  $\rightarrow$  Has several uses. Following are a few example:

- $\bullet$  .  $\to$  Display all the files and directory inside the present directory ( replace dot with a directory name to display everything in that directory)
- $\bullet$  . -type  $d/f \to Display$  all the directory/file in the present directory

- . -type f -fname "test\*" → Display the location of all the files and the name of the files which start with name test ( use -iname instead of -name to make search case insenitive. )
- . -type f -mmin -/+t  $\rightarrow$  Display all the files modified in less/more than t minutes ( use -mtime for days)
- . -size  $+5M \rightarrow$  Display all the files larger than **5 MB** in size ( use 'k' for kilobytes and 'G' for gigabytes)
- $\bullet$  . empty  $\rightarrow$  Display all the empty files

grep -winlr -A/B x "str" file.ext  $\rightarrow$  Search for text str in the file file.ext.

- ullet w o Only display the ones with the whole match
- $i \rightarrow$  Make the search case insensitive
- $n \to Display$  the line number
- I → Display only the files which has str (doesn't show line numbers) ( using 'c' instead of 'l' which also display the number of matches in each file )
- ullet r ightarrow Does recursive search, in the present and all the other sub-directories
- A/B  $\rightarrow$  Display **x** number of lines after/before the place where  $\mathbf{str}$  has been used
- $\mathbb{C} \to \text{Display } \mathbf{x}/2$  number of lines before and after the place where  $\mathbf{str}$  has been used

## crontab

 $\operatorname{crontab}$  -e  $\to$  Gives you access (edit) to the  $\operatorname{crontab}$  file

In the edit mode type the task you want to schedule in the following way:

\* \* \* \* \* command

- \* means minute ( 0-59 )
- \* means hour (0-23)
- $\bullet$  \* means day of the month ( 1-31 )
- \* means month of the year (1-12)
- $\bullet\,$  \* means day of the week ( 0-6, Sunday to Saturday )

 $\operatorname{crontab} -r \to \operatorname{Removes}$  any stored crontask!

Be very icareful while executing this command. Will wipe out every stored tasks!

## **RSYNC**

Notes 2: Use **crontab** to start the rsync options rsync  $/\text{dir}/\text{dir}1/^*$  /dir2/  $\rightarrow$  Copies every file in /dir1/ into /dir2 (Set \* to filename if you want to transfer a specific file)

rsync -r /dir/dir1/ dir2/  $\rightarrow$  Copies everything (including directories) from /dir1/ into /dir2

Notes 3: Use of '/' after dir1 is important. It makes sure that the content of dir1 is copied into dir2 and not the dir1 itself.

rsync -av -in (or - -dry-run) - -delete /dir/dir1/\*  $dir2/ \rightarrow Syncs$  files from /dir1 to /dir2 with various options.

i) -a: Stands for 'archive', recurses into directory like '-r' and preserves the information like modified date, owners etc.

ii) -av: 'v' stands for verbose, thus it prints out the list of files it is changing.

iii) -in (or - -dry-run): Shows the list of files and folders which will will be copied (needs '-av' before it prints).

iv) - -delete: Completely syncs /dir1 to dir2, meaning, it will delete any file/folder from /dir2 which weren't present in /dir1. Be super careful while using this command.

## VS Code

Note 3: For detailed descriptions click on the following link

Notes 4: By default, the **VS code** is in **vim** mode, so any short-cut that is also in **vim** won't work.

 $\operatorname{Ctrl}+$  or -  $\to$  Change the font size of various UI elements

 $Ctrl+\ \rightarrow Open$  another editor side by side (similar to :vs functionality of vim)

 $\begin{array}{l} \textbf{Shift+Alt} \rightarrow \textbf{Box selection or column aligned selection} \end{array}$ 

 $Alt \rightarrow Fast scrolling (5x)$ 

Alt+Up or Alt+Down  $\rightarrow$  Move a selection of lines up or down (works in VI mode)

Shift+Alt+Left or Shift+Alt+Right  $\rightarrow$  Shrink or expand selection

Shift+Alt+Up or Shift+Alt+Down  $\rightarrow$  Copy the line below or above the present line

Ctrl+Shift+[ or Ctrl+Shift+]→ Code folding or expanding (if folded)

 $Alt+F12 \rightarrow Peek$  at the definition and options (a new small window opens up with definition, press Esc to close the new window)

 $F12 \rightarrow Go$  to the definition file (opens a new tab) select a word +  $F2 \rightarrow$  Rename all occurrences of the selected word by renaming it to whatever.

## GIT

git config –global credential.helper "cache – timeout=360"  $\rightarrow$  Saves your credentials for 360 seconds so that you won't have to enter password for every push and pull requests.

git add  $-a \rightarrow$  add all the file for committing git add  $-a \rightarrow$  Commit all the added files for pushing to the repository

git push  $\rightarrow$  Push all the committed file to the online repository/branch

git config –global alias.hist "log –pretty=format: '%h %ad — %s%d [%an]' –graph –date=short"  $\rightarrow$  Aliasing hist command for GitHub

git hist  $\rightarrow$  Check the history of commits on GIT git clone "url" "where to clone"  $\rightarrow$  Clone a remote repository to your local directory

git merge "branch" → Merges the branch to the present branch (the one you are in)

git branch -d "branch"  $\rightarrow$  Delete branch locally git push origin –delete "branch"  $\rightarrow$  Delete branch from the online repository

git checkout afe<br/>52  $\rightarrow$  checkout the commit based on the hash

git checkout 'master@1918-05-11 12:00:00'  $\rightarrow$  Checkout based on date

git checkout @314.days.ago  $\rightarrow$  Checkout based on day

git  $\log \rightarrow$  To check the commits

git commit -m "insert message here"  $\rightarrow$  Make commit along with a message

git  $\log \rightarrow$  To check the commits

 $git reset \rightarrow Uncommit all the files$ 

git reset –hard  ${
m ID} \to {
m will}$  make local code and local history be just like it was at that commit

git reset –soft  $ID \rightarrow$  will make local files changed to be like they were then, but leave your history etc. the same.

git cherry-pick  $\mathbf{ID} \to \mathbf{Sets}$  the present repository to the state of other repository whose  $\mathbf{ID}$  was used. git stash save "message"  $\to$  Stash the changes and return the files to before the all the changes made to it

git stash list $\rightarrow$  Lists out all the stashed instances along with their IDs

git stash apply "stash ID" → Apply the stashed file. (this way the Stash ID is still stored and doesn't get deleted)

git stash pop  $\rightarrow$  Grabs the stash on the top of the list, applies it, and drop the stash

git stash drop ID  $\rightarrow$  Drops the stash of that ID

# Active Aliases in .bash \_aliases file

- ..="cd .."
- ...="cd ../.."
- ....="cd ../../.."
- .....="cd ../../.."
- ~ = "cd ~"
- dr="cd ~/Dropbox/Studies/Research"
